About RFID Alliance Lab

- ◆ Provide useful, timely, credible, and unbiased data to end users of RFID products
- ◆ Constituents
 - ◆ **University of Kansas / ITTC:** Primary research contributor
 - ◆ **RFID Journal:** Initial funding, distributor, advertisement
 - ◆ **Rush Tracking Systems:** Initiator, subject expert, industry lesion
- ◆ Business model
 - ◆ Sell reports (~\$1,000 / report) to finance future reports
 - ◆ Advisory Board
 - ◆ Site license to reports
 - ◆ Use facilities, products

Why us, why now?

- ◆ RFID Revolution is under way; the train has left the station (are you on board?)
 - ◆ Disruptive technology
 - ◆ “Black magic?”
- ◆ Need to separate facts from hype
 - ◆ Educate
 - ◆ Press releases don't present all relevant facts
 - ◆ Problems / issues not exposed, little or no data
- ◆ Focus on technology: what do you (end users) need to know?

Passive EPC Tags Analyzed by Lab (partial)

Tags:

- ◆ Matrics X2040
- ◆ Avery Triflex
- ◆ Rafsec 457
- ◆ Rafsec 458
- ◆ Alien 9250
- ◆ Alien 9338
- ◆ Alien 9254
- ◆ Avery U1014
- ◆ Matrics I2010
- ◆ Avery DS1

RFID and Pharma

- ◆ EPC RFID tags generally focus case- and palette-level tagging
- ◆ Physically large (95×15 to 95×106 mm)
- ◆ High performance (20+ feet read range)
- ◆ Usually read in small quantities
- ◆ Writable
- ◆ Pharma tags focus on item-level tagging
- ◆ Physically small (25×25 to 30×36 mm)
- ◆ Low performance (~5 feet)
- ◆ Often read in large populations
- ◆ Read-only or lockable

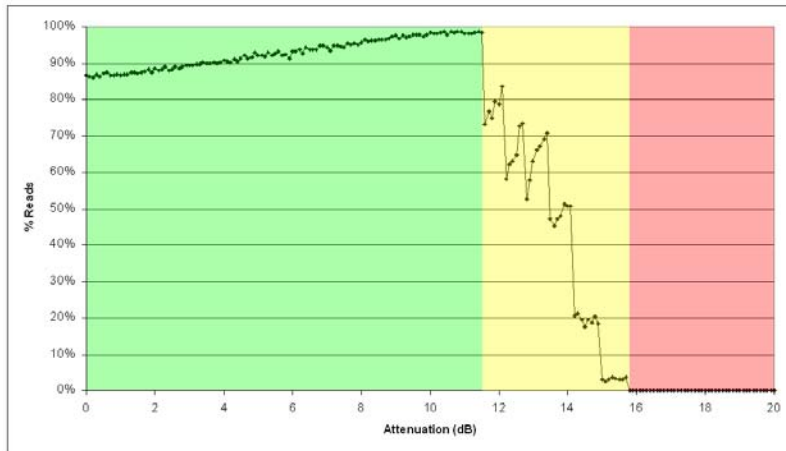

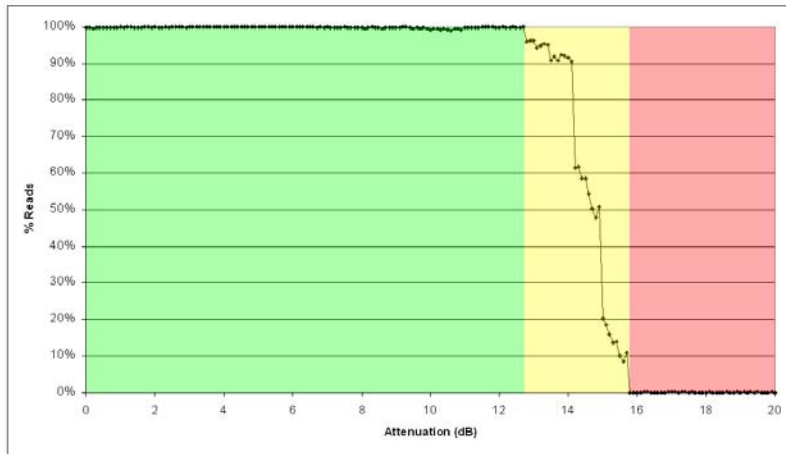

Matrics Pharma vs. Matrics X2040 (Size to scale)

Tag Performance vs. Distance

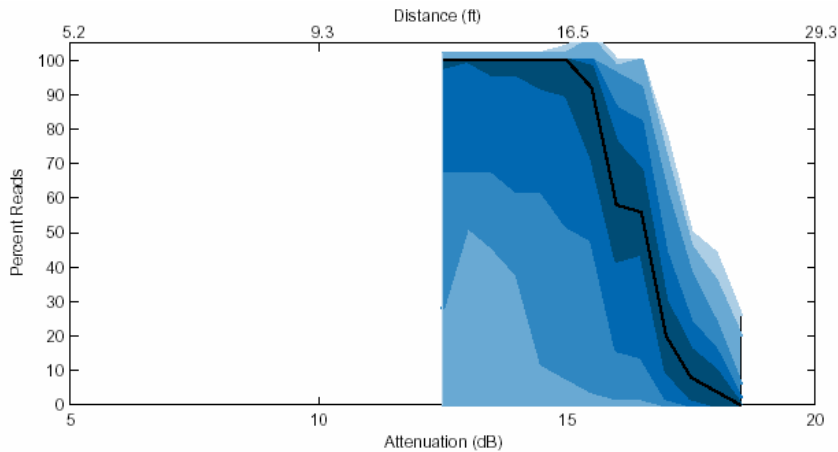

- ◆ Typical Class 0, 1 percent reads vs. attenuation (distance)
 - ◆ Strong in-field
 - ◆ 100% vs 85-99%
 - ◆ Weak in-field
 - ◆ Bumpy ride down
 - ◆ Out of field
 - ◆ 0 vs 0.13% “phantom” reads

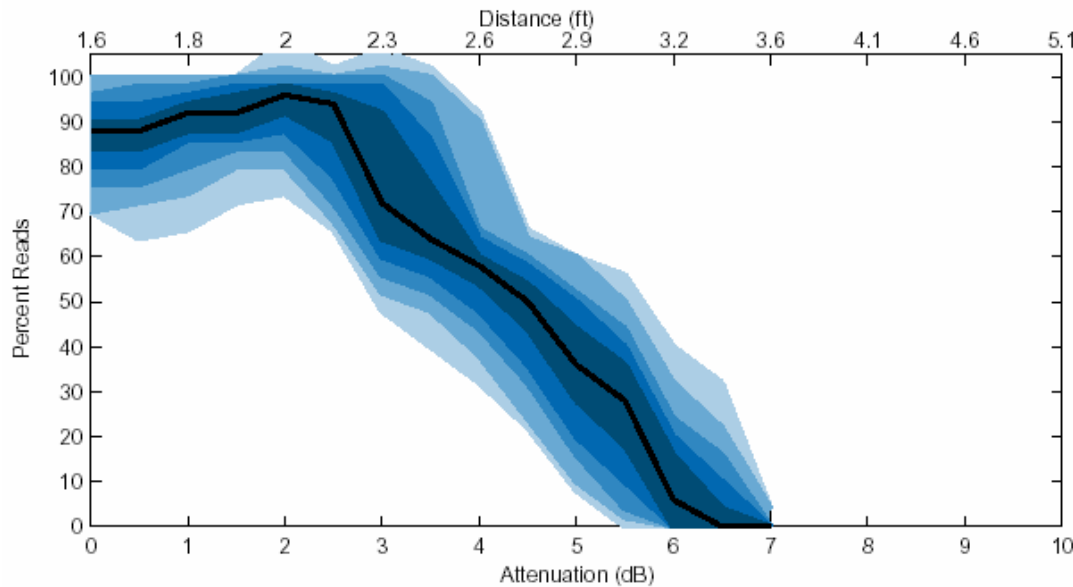

Tag Variation — The Bad News

- ◆ Tags vary in performance
 - ◆ Model to model
 - ◆ Tag to tag
- ◆ Narrow bands = high quality
- ◆ Far right = high performance

Range	Lower Bound	Upper Bound	% Included
Black	50%	50%	1 tag
Darkest	30%	70%	40%
	15%	85%	70%
	6.5%	93.5%	87%
	1%	99%	98%
Lightest	0%	100%	100%

Pharma Tag Performance

- ◆ Narrow bands indicate good quality
- ◆ Very far left indicates poor performance

Performance of Class 1 Tags near Water

Differences readily apparent

- ◆ Pink best close, but shallow slope
- ◆ Purple good close, but best further
- ◆ Best tag:
 - ◆ 150% more efficient than worst
 - ◆ 60% further distance
- ◆ Some tags are tuned for applications
 - ◆ Free air perf. not always fair metric

Tag Read Rate in Isolation

	Reader 1	Reader 2	Reader 3
“Fast” Class 1	24.1	61.4	
“Slow” Class 1	7.0	4.5	
Typical Class 0	6.5		8.8
Class 0 Pharma	6.1		7.6

- ◆ Two “classes” of Class 1 tags: Fast and Slow
- ◆ New, 96 bit Class 1 tags similar to “Slow”
 - ◆ May need to tune reader (timeout parameter)
- ◆ Class 0 tags steady
- ◆ Pharma Class 0 tag only slightly slower than other Class 0

Read Rates in Populations

Class 1: Time to First Read

- ◆ ~140 Class 1 tags
- ◆ Perform experiment 10 times; show worst, median, best
- ◆ Note: Log Y axis
- ◆ Linear TFR until about 85-90 tags, then exponential
- ◆ Last few tags sometimes unreadable

Class 0: Time to First Read

- ◆ ~115 Class 0 tags
- ◆ Exponential past ~70 tags
- ◆ Much faster than Class 1

Pharma (Class 0) Time to First Read

- ◆ 48 Pharma tags, 42 on one plane
- ◆ Note: Linear Y axis
- ◆ Always reads 45 tags in 1 second, 47 in 3 seconds.
- ◆ Last tag(s) are problematic!

Tag Read Rates in Population

- ◆ Speculate:
 - ◆ Class 0 & Class 1 tags all weak-in-field
 - ◆ ~2/3 Pharma strong-in-field
- ◆ Class 0 scales much better than Class 1

Ingredients for Good Performance

- ◆ Use Class 0 for large populations
- ◆ A readable tag does not imply good performance
- ◆ Try to get *all* tags strong in field
- ◆ Coupling and shadowing happen
 - ◆ Tag density will negatively impact tag performance
 - ◆ Pharma tags seem to handle density well

Observations and Conclusions

- ◆ Pharma tags are different
 - ◆ Smaller, shorter range, designed for density
 - ◆ Higher quality (limited sampling)
- ◆ Good news: Pharma tags perform well
 - ◆ 0% dead and “quiet” vs. 1-19% for other EPC tags
- ◆ Key to performance: get all tags strong in field
- ◆ Pharma industry needs vendor-neutral education, procedures, standards
