

EECS 562  
Homework #6

1. A 4 kHz message signal is transmitted using DSB-SC with a carrier frequency  $f_c=200\text{kHz}$  over a noisy channel with noise power spectral density of  $\eta/2=2 \times 10^{-17} \text{ W/Hz}$ . The received signal power is  $-75\text{dBm}$ . What is the post-detection S/N?
2. An AM receiver uses an envelope detector. The transmitter operates at total transmit power of  $1\text{KW}$  with a 50% modulation index. The information signal is  $m(t) = \sin(2000\pi t)$ . The path loss between the transmitter and AM receiver is  $90 \text{ dB}$ . The noise power spectral density of  $\eta=-113\text{dB/Hz}$ . The RF bandwidth is  $10\text{kHz}$ . What is the post-detection S/N?
3. Consider an FM transmitter with a transmitter power of  $200\text{KW}$ . The path loss is  $90\text{dB}$ ,  $\eta=-113\text{dB}_w$ . The baseband bandwidth is  $53 \text{ kHz}$ . The modulation index is  $\beta=5$ .
  - a) Find the  $(S/N)_{bb}$ ?
  - b) Find the  $(S/N)_o$ ?
4. Consider an FM transmitter with a transmitter power of  $200\text{KW}$ . The path loss is  $90\text{dB}$ ,  $\eta=-113\text{dB}_w$ . The baseband bandwidth is  $53 \text{ kHz}$ .
  - a. Find  $\beta$  such that the  $(S/N)_o=35\text{dB}$ ?
  - b. What is  $B_{RF}$ ?
5. Comparison of system resources (power and  $B_{RF}$ ) for different modulation schemes. In this case:
  - Path loss =  $90\text{dB}$
  - $\eta = -113\text{dB}_w$
  - $B_x = \text{baseband bandwidth} = 53 \text{ kHz}$
  - a. To meet a required output signal-to-noise ratio,  $(S/N)_o=44.5\text{dB}$  fill out the table below:

Modulation	Transmit power = $P_T$ (dB <sub>w</sub> )	Transmit power = $P_T$ (Watts)	$B_{RF}$ (kHz)	$B_{RF}/B_x$ BW Expansion Factor
DSB-SC				
SSC				
AM with $m = 0.5$				
AM with $m = 1.0$				
FM with $\beta=1.67$				
FM with $\beta=5$				
FM with $\beta=7.5$				

- b. For the FM cases above discuss the trade-off between  $B_{RF}$  and  $P_T$ .
- c. Comment of the feasibility of using each modulation format given the required transmit power.
