

Special Problem 2-4.10

Consider the vector field $\mathbf{A}(\bar{\mathbf{r}})$:

$$\mathbf{A}(\bar{\mathbf{r}}) = \rho^3 \hat{\mathbf{a}}_\rho + (\rho - z) \hat{\mathbf{a}}_\phi + \rho z \phi \hat{\mathbf{a}}_z$$

The value of this vector field, at the point denoted by position vector $\bar{\mathbf{r}}_1$, is the discrete vector:

$$\mathbf{A}(\bar{\mathbf{r}} = \bar{\mathbf{r}}_1) = 27 \hat{\mathbf{a}}_\rho + 2 \hat{\mathbf{a}}_\phi + \pi \hat{\mathbf{a}}_z$$

Determine position vector $\bar{\mathbf{r}}_1$.
